

Taris for inside bathrooms

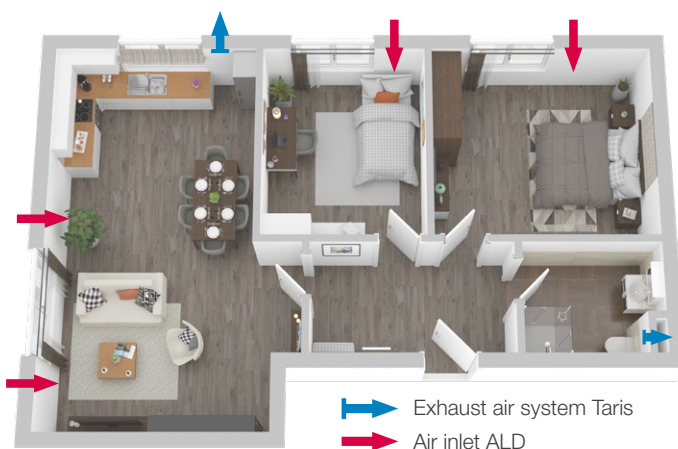

In a typical apartment building, there are often indoor bathrooms or storage rooms. Due to the lack of fresh air supply, moisture damage can easily occur here – the perfect breeding ground for health-threatening mould.

This can be avoided by controlled ventilation and regulated air exchange according to **DIN 18017-3**.

For windowless bathrooms, the Taris by inVENTer is particularly suitable. It can be installed on a shaft, for example – for effective moisture protection.

Example: extract air system with Taris and air inlets

The most important short facts

- + Available as surface-mounted or flush-mounted variant
- + Ceiling or wall mounting
- + Optional humidity and air quality sensor
- + Exhaust air volume flow up to 100 m³/h, individual adaptation for large projects possible
- + Complies with DIN 18017-3
